Some features are only available to users of the AutoCAD LT, AutoCAD and AutoCAD Architecture software packages, others are available to all users. Access to files in AutoCAD format is available via the cloud storage services Box, Dropbox, Google Drive and OneDrive, and via the 3D Warehouse service. It is also possible to access files in the 2D and 3D format through the web-based 2D/3D Warehouse, Autodesk.com, or through Autodesk Media and Entertainment. The Autodesk Design Center feature of AutoCAD allows users to access a library of online content.

Projects The typical architectural project workflow includes conceptual design, design development, construction document preparation, construction management, and construction documentation.

Conceptual Design The conceptual design phase involves the creation of all the geometric entities that will be used in the design. This includes 3D modeling, 2D drafting and 2D design. Once the design is complete, it is approved by the owner, design team, and construction team. The design is then decomposed into separate elements. These elements are then entered into the design software as separate drawings, blocks, or regions. Once the design is completed, drawings, parts, schedules, and other documentation are generated. These documents are then routed to other team members for review and comment.

3D modeling 3D modeling is the process of creating geometry in 3D space. There are two types of modeling, solid and surface. Solid modeling is the creation of geometry that is visible from all angles. Surface modeling is the process of creating 2D topology. This means that the geometry is created so that it is easy to cut. The geometry created during the modeling stage is converted into the necessary formats (such as DWG or DXF) that can be sent to other people. The most common example of a tool used for solid modeling is the 3D modeling tool. The 3D modeling tool is used to create solids such as concrete and brick walls. a1d647c40b
